

Acceptance of Aerial Communication Optical Cables

Overview

This part of IEC 60794 covers cable construction, test methods, optical, mechanical, environmental and electrical performance requirements for aerial optical fibre cables and cable elements which are intended to be used along power lines (OCEPL) as a high bandwidth transport media. This part of IEC 60794 covers cable construction, test methods, optical, mechanical, environmental and electrical performance requirements for aerial optical fibre cables and cable elements which are intended to be used along power lines (OCEPL) as a high bandwidth transport media. The construction procedures of general optical cable lines are mainly divided into five stages: preparation, laying, connection, testing and completion acceptance. However, it is not always easy to find out what has been covered, and where it can be found. The cables can also be used in other overhead utility networks, such as for telephony or TV services. Existence. Aerial Cable Installation Deploying fiber above ground on poles or towers removes the need for underground digging and is particularly useful when the ground is uneven, rocky or both.
