

After fiber optic cable termination

Article Overview

After fiber optic cable termination, the next steps involve inspection, cleaning, testing, and integration to ensure optimal network performance.

Inspection and Cleaning

Once a fiber optic cable is terminated, it is crucial to inspect the connector or splice for any defects, misalignment, or damage. Use a fiber inspection microscope to check the end-face for scratches, chips, or contamination, as even small particles can cause significant signal loss. After inspection, clean the connector using appropriate fiber cleaning tools or wipes to remove dust and debris, ensuring a low-loss connection.

Testing and Verification

After termination, testing the fiber is essential to verify signal integrity. Common tests include:

- Insertion Loss (IL): Measures the signal power loss at the connection point; lower values indicate better performance.
 - Return Loss (RL): Assesses reflections at the connector or splice, which can affect high-speed data transmission.
 - Visual Fault Inspection (VFI): Detects breaks, bends, or defects along the fiber path.
- Testing ensures that the terminated fiber meets network specifications and prevents future connectivity issues.

Integration into the Network...
