

Automatic Cable Tray Forming Line

Article Overview

An Automatic Cable Tray Forming Line is a fully automated system for producing various types of cable trays with high precision, efficiency, and customizable specifications.

Overview

An automatic cable tray forming line is designed to manufacture cable management systems such as trough, perforated, and ladder-type trays from metal sheets. It integrates decoiling, leveling, punching, notching, roll forming, straightening, and cutting into a continuous automated process, controlled by a PLC system for high efficiency and minimal labor input. The line is suitable for industrial, commercial, and infrastructure projects requiring consistent quality and structural reliability.

Key Components and Workflow

- **Decoiling and Feeding System:** The line starts with a coil unwinder and feeder, often equipped with hydraulic tensioning and servo motor control to ensure precise, continuous feeding of metal sheets.
- **Leveling:** Metal sheets pass through leveling rollers to remove curvature and ensure flatness, which is critical for accurate forming.
- **Punching and Notching:** CNC-controlled punching units create ventilation holes, weight-reducing perforations, or custom hole patterns. Proper punching design improves heat dissipation by 15–20% while maintaining mechanical strength.
- **Roll Forming:** The sheet is gradually bent through multiple forming stations (typically 18–32) to achieve the desired cross-sectional shape, such as stepped, trough, or ladder profiles
