

Broadband Management Switch Port Aggregation

Overview

Link aggregation, also known as port aggregation or NIC teaming, is a technique used in layer 2 and layer 3 network switches to combine multiple physical links into a single logical link. This logical link provides increased bandwidth, redundancy, and load balancing. Port aggregation is useful for implementing load balancing and provides a redundant link. Link aggregation is a term used to describe various implementations and underlying technologies. While there are many approaches, this article aims to highlight the. Switch-to-Switch Aggregation: This is useful in scenarios where you need to interconnect multiple switches to increase the bandwidth available between them and ensure network redundancy. It helps in managing higher traffic loads between switches. APs and wireless clients can continue to send and receive data.
