

Cable laying operation in cable tray

Article Overview

Cable laying on a cable tray involves careful planning, proper support installation, stress-free cable pulling, and secure termination to ensure safety and long-term reliability.

Preparation and Material Handling

Before starting, all materials including cable trays, ladders, trunking, and accessories should be inspected for compliance with approved submittals and checked for damage. Materials must be stored horizontally on a flat surface with timber supports at intervals of about 1 meter and protected from moisture and sunlight . Review the approved shop drawings to confirm tray routes, lengths, and locations, ensuring no clashes with other services and maintaining adequate clearance for cable pulling and future maintenance .

Installation of Cable Tray Supports

Mark the support locations along the tray route. Install threaded rod supports with appropriate anchors, then fix 'L' angles or slotted 'C' channels using nuts. Maintain a maximum spacing of 1.2 meters between supports to prevent sagging. Provide additional support at bends, branches, offsets, and joints. For vertical trays, ensure load-bearing cleats are installed. All cut or drilled edges should be treated with zinc-rich paint to prevent corrosion .
