

Cable tray tee at any angle

Article Overview

Cable tray tee fittings are used to branch a cable tray run at a T-junction and are typically available in standard angles such as 30°, 45°, 60°, and 90°.

Overview of Cable Tray Tee Fittings

A cable tray tee is a fitting that allows a main cable tray run to split into two directions, forming a "T" shape. These fittings are essential for routing cables efficiently in data centers, industrial facilities, and electrical installations, ensuring proper support and organization of cables. Tee fittings can be used with ladder trays, channel trays, or other tray types depending on the system design.

Standard Tee Angles

Cable tray tees are manufactured in common angles to accommodate different routing requirements:

- 30° Tee: Provides a gentle branch for minor directional changes.
- 45° Tee: Commonly used for moderate directional splits.
- 60° Tee: Suitable for sharper branching while maintaining cable integrity.
- 90° Tee: Creates a perpendicular branch, often used in tight layouts or when connecting perpendicular runs. When a standard angle does not fit the installation, adjustable elbows or custom tees can be used to achieve the desired routing.
