

Cable tray turning a right angle bend

Article Overview

A right-angle (90°) bend in a cable tray can be achieved using pre-fabricated elbows, bending tools, or on-site fabrication techniques depending on the tray type and project requirements.

Using Pre-Fabricated Elbows

For many cable tray systems, especially steel or modular trays, pre-manufactured 90° elbows are available. These fittings are designed to maintain the tray's structural integrity and provide a smooth path for cables, reducing stress and potential damage during installation. They are the simplest and most reliable method for creating a right-angle turn.

On-Site Fabrication Techniques

If a pre-made elbow is not available, you can fabricate a bend on-site using several methods:

- **Bending with a Tool or Bar:** For steel trays, a crimping tool or a sturdy metal bar can be used to gradually bend the tray to 90°. This method is useful when a bending machine is not available. The process involves lifting and bending the tray sides incrementally to achieve a smooth curve.
- **Cut-and-Bend Method:** For wire mesh or basket-type trays, you can cut triangular sections from the side walls and bend the tray to form the desired angle. For example, a 600mm wide tray can be divided into multiple smaller angles (e.g., 2 x 45° or 3 x 30°) to create a sweeping 90° bend. Rubber caps or protective coatings...
