

Commonly Used Cable Tray Connectors

Article Overview

Cable tray connectors include elbows, tees, reducers, joint connectors, and cover clips, each designed to join, redirect, or secure cable trays efficiently.

Common Cable Tray Connectors

1. Elbow Connectors Elbows are used to change the direction of a cable tray run. They come in horizontal elbows for side-to-side turns and vertical elbows for upward or downward transitions, allowing smooth routing of cables around obstacles .
2. Tee Connectors Tee connectors enable a cable tray to branch into three directions, forming a T-shaped junction. They are ideal for distributing cables to multiple areas from a main tray line .
3. Cross Connectors Cross connectors allow four-way intersections, enabling cable trays to split in multiple directions. They are commonly used in complex installations where multiple cable routes converge .
4. Reducers Reducers connect cable trays of different widths, ensuring a smooth transition between larger and smaller tray sections. They help maintain proper cable support and spacing .
5. Joint Connectors Joint connectors, also called splice plates, are used to join two straight sections of cable tray securely. They maintain structural integrity and alignment of the tray system .
6. Cover Clips Cover clips secure tray covers in place, protecting cables from dust, debris, or accidental contact. They are essential for enclosed or solid-bottom trays .
7. Vertical and Horizontal Risers Risers are specialized connectors that allow cable trays to move vertically or horizontally between different levels or floors, maintaining proper cable routing .
