

Configuration of Core Switch for Company Leased Line

Article Overview

A core switch for a leased line should be configured with routed interfaces, proper IP addressing, VLAN termination, and management access to ensure seamless connectivity between the corporate LAN and the ISP or remote branch.

Network Architecture Overview

A leased line provides a dedicated point-to-point connection between your company and an ISP or another branch office, ensuring reliable and secure data transfer . Typically, the leased line terminates at a CSU/DSU or managed router, which then connects to the core switch. The core switch acts as the distribution point for internal VLANs and routes traffic to the leased line for external communication .

Core Switch Configuration Steps

1. Interface Configuration

- Assign the interface connected to the leased line router as a routed interface (Layer 3).
- Example for Cisco Catalyst:

```
Switch(config)# interface GigabitEthernet0/1Switch(config-if)# no  
switchportSwitch(config-if)# ip address 192.168.1.2 255.255.255.252Switch(config-  
if)# no shutdown...
```
