

Connection between distribution box and wall panel

Article Overview

A distribution box is connected to a wall panel (main electrical panel) via dedicated feeder wires, allowing safe and organized distribution of electricity to specific circuits or areas.

Overview of Components

A wall panel, also called a main panel or breaker panel, is the primary point where electricity from the utility enters a building. It contains the main disconnect breaker, bus bars, neutral and ground bars, and circuit breakers that protect individual circuits . A distribution box (DB box) is a smaller enclosure that receives power from the main panel and distributes it to localized circuits, often in a specific room, floor, or equipment area .

Wiring Connection

The connection between a wall panel and a distribution box is typically made using dedicated feeder wires. These wires carry the electrical load from the main panel to the DB box and are sized according to the current rating of the circuits they serve . The feeder wires include:

- Hot wires (live conductors) connected to the main panel's bus bars
 - Neutral wire connected to the neutral bar
 - Ground wire connected to the grounding bar
- The distribution box then routes pow...
