Coupler Fiber Crystal

Article Overview

A Coupler Fiber Crystal is a fiber-optic device that splits or combines light using photonic crystal fibers or polarization-maintaining crystal fibers.

Overview

A fiber coupler is an optical device that connects one or more input fibers to one or more output fibers, distributing light between them. In the context of crystal fibers, these couplers can be made from photonic crystal fibers (PCFs) or polarization-maintaining (PM) crystal fibers, which preserve the polarization of light while coupling . They are widely used in telecommunications, sensing, and laser systems.

Photonic Crystal Fiber Couplers

Photonic crystal fiber couplers are fabricated by stacking silica tubes around a central silica rod and drawing them into a fiber. The fused biconical taper method is commonly used to create the coupler, where fibers are tapered and fused to allow light to transfer between cores . Coupling ratios depend on the fiber design:

• A fiber with five hexagonally stacked layers of air holes can achieve a 33/67 coupling ratio.
• A fiber with one layer of four holes can achieve a 48/52 coupling ratio . These couplers are highly customizable and can be designed for specific wavelength ranges and applications.
