

Data centers are the foundation of the internet

Overview

Data centers are foundational infrastructure for the modern economy. In short, they are the computers we use but don't touch. Once considered dull, gray structures, these facilities have become the critical infrastructure that powers everything we rely on today—social media, artificial. These facilities are called data centres - and they're the backbone of the internet. Data centres store, process, and protect the massive amounts of data that keep our digital world running smoothly. ☐☐ Let's look at what data centres are, how they work, and why they're so essential for everything. A data center is a physical room, building, or facility for the purpose of the storage, management, and dissemination of data and information, including training artificial intelligence, housing IT infrastructure, computer systems, and associated components.
