

Detailed structural diagram of a three-level distribution box

Article Overview

A three-level distribution box system consists of a main distribution box, secondary distribution boxes, and final-level switch boxes, forming a hierarchical tree-like power distribution network.

Overview of the Three Levels

First-Level Distribution Box (Main Distribution Box): This is the primary hub installed near the power source. It receives incoming electrical energy and distributes it to the second-level boxes. Key components include the main circuit breaker, main leakage protector, voltmeter, and ammeter. It provides centralized control and monitoring for the entire site and determines the main switch rating based on the number of downstream boxes and total load . **Second-Level Distribution Box (Sub-Distribution Box):** Installed near large electrical equipment or in specific power consumption areas, it receives power from the main box and redistributes it to third-level boxes. It typically contains branch circuit breakers and branch leakage protectors to protect and manage each branch circuit . **Third-Level Distribution Box (Switch Box):** This is the final junction box directly connected to electrical equipment. It provides power to individual devices and includes the last layer of protection, such as leakage protection switches. It can be fixed or movable depending on the equipment layout .

Internal Structure and Components

A typical distribution box includes:...
