

Distance of 110kV to communication optical cable

Article Overview

For a 110 kV overhead power line, the recommended minimum safe separation from communication optical cables is approximately 1.2 meters (48 inches) or more, depending on installation type and local regulations.

Aerial Cable Installations

For overhead optical fiber or communication cables near high-voltage lines, safety guidelines such as OSHA and NESC recommend maintaining a minimum approach distance of 48 inches (1,219 mm) for voltages between 87.5 kV and 121 kV to prevent electrical hazards and reduce electromagnetic interference . Proper bonding and grounding of both the power and communication cables are essential to mitigate induced voltages and ensure signal integrity . Crossing power lines at a 90-degree angle is also recommended to minimize parallel exposure and EMI .

Buried Cable Installations

When burying optical cables near high-voltage power lines, there is no universally mandated separation, but a soil separation of 12-24 inches (300-600 mm) is generally recommended as a safety barrier and for locating purposes . Local or state regulations may require greater distances. Using separate conduits or metallic shielding can further reduce the risk of interference and improve safety .
