

Distribution box circuit not working

Article Overview

A distribution box circuit may fail due to tripped breakers, blown fuses, short circuits, loose connections, or insufficient power supply.

Safety First

Before inspecting the distribution box, turn off the main power to avoid electric shock. Never touch live components without proper safety precautions, and if unsure, contact a licensed electrician .

Common Causes

- Tripped or Blown Circuit Breakers/Fuses: Overloaded circuits, short circuits, or ground faults can trip breakers or blow fuses, cutting power to the circuit .
- Short Circuits: Occur when live and neutral wires touch directly or through a faulty appliance, causing high current that trips protective devices .
- Loose or Damaged Connections: Poorly installed wires, vibration, or aging can lead to arcing, overheating, or intermittent power .
- Insufficient Power Supply or Voltage Drop: Long cable runs or undersized wires can reduce voltage, preventing the circuit from functioning properly .
- Faulty Components: Aging breakers or damaged wiring can fail to deliver power even if the main supply is active .

Diagnostic Steps

- Check the Power Supply: Use a voltmeter to ensure the distribution box is receiving adequate voltage .
- Inspect Breakers and Fuses: Identify any tripped breakers or blown fuses and rese...
