

Enclosed busbars belong to cable trays

Overview

A bus duct (busway system) is a prefabricated power distribution system that uses solid copper or aluminum busbars enclosed in a protective housing. Busbar systems are often preferred over cables because they save space, install faster, offer greater flexibility for changes, and provide enhanced reliability, frequently leading to a lower total cost of ownership. You might wonder how these advantages translate into real-world benefits for your. Busbar enclosures (also called busways, bus ducts, bus boxes and termination boxes) are specialized electrical enclosures that safely house copper or tin-plated copper busbars carrying very large currents for power distribution. Unlike traditional cables, it provides superior protection against accidental contact and requires significantly less installation space. They consist of insulated conductive bars housed within a durable metal casing, such as sheet metal or aluminum.
