

Full Process of Underground Cable Laying in Cable Trays

Article Overview

Underground cable trays are installed by carefully planning the route, preparing a trench with protective bedding, laying the trays and cables, and covering them with protective layers to ensure safety and durability.

Planning and Route Preparation

Before any excavation, plan the cable tray route according to your site layout, electrical design, and load requirements. Consider clearance, future maintenance access, and separation from other utilities. Mark the route clearly to avoid obstacles and ensure proper alignment of the trays .

Trench Excavation and Bedding

- Excavate a trench typically 1.5 meters deep and 0.45–0.5 meters wide, depending on cable size and number of trays .
- Lay a 10 cm layer of fine sand at the bottom of the trench to act as a cushion and prevent moisture from damaging the cables .
- For multiple cables, maintain horizontal or vertical spacing of at least 30 cm to reduce mutual heating and prevent damage in case of faults .

Installing Cable Trays

- Place cable trays or troughs (made of cement, stoneware, or metal) along the tre...
