

Horizontal cable tray turning and translation

Article Overview

Horizontal cable tray turns and translations are achieved using bend transition trays or flexible adjustable splice plates, allowing smooth directional changes while maintaining proper cable support and bend radius.

Horizontal Turns

Horizontal turns in cable tray systems are typically accomplished using 90° bend transition trays or similar fittings. These trays provide a smooth bend radius, often around 24 inches, to facilitate easy installation of cables such as coaxial or data cables without exceeding their minimum bend radius requirements. They connect to standard cable trays using splice clamps, and are available in various widths and depths to match the main tray system (e.g., 12", 18", 24" widths with 4" or 6" depths) .

Horizontal Translation and Adjustable Splices

When standard horizontal fittings do not align with the desired routing, flexible horizontal adjustable splice plates can be used. These splices allow for field adjustments to achieve the required horizontal angle. Installation involves:

- Preparing the cable tray and splice plates.
- Determining the desired angle for the turn.
- Field cutting the tray or ladder to fit the splice.
- Removing any affected rungs if necessary....
