

How long is the cable fixing point to the cable tray

Article Overview

Cable tray fixing points are typically spaced up to 3.6 meters apart, with closer spacing required for heavy loads or specific installation conditions.

Horizontal Tray Support Spacing

For standard ladder or ventilated trough cable trays, the maximum support spacing is generally 3.6 meters (12 feet) for center-hung or side-hung installations, depending on the tray type and load capacity . For example, a 6-meter tray would typically have supports approximately 1.5 meters from each end to ensure stability and prevent sagging . The spacing may need to be reduced if the tray carries heavy power cables, large bundles, or sensitive instrumentation cables .

Vertical Runs and Strain Relief

Vertical cable runs require special attention to prevent excessive mechanical strain. For vertical runs exceeding 32 meters, strain relief sections should be incorporated, typically by offsetting the cable by at least two cable diameters per section . For very long vertical runs (over 100 meters), additional measures such as short horizontal sections of at least 1 meter are recommended to relieve tension and prevent displacement .
