

How to bend cable trays vertically

Article Overview

Vertical bends in cable trays are achieved using pre-fabricated fittings or by carefully forming the tray to change elevation while maintaining cable support and bend radius.

Overview

Vertical bends in cable tray systems allow cables to change elevation, such as moving from a ceiling to a lower level or transitioning between floors. These bends are essential for maintaining proper cable routing, avoiding sharp angles that can damage cables, and ensuring compliance with standards like DIN EN 61537 for cable support systems .

Methods for Vertical Bending

- Pre-fabricated Vertical Bend Fittings
- Most cable tray manufacturers provide vertical elbows or bends designed for specific tray types (ladder, solid-bottom, or mesh trays).
- These fittings maintain a smooth bend radius, preventing cable stress and ensuring mechanical support .
- They are available in standard angles (e.g., 30°, 45°, 60°, 90°) and can be combined for custom elevation changes.
- Field Bending (Manual or Mechanical)
- For certain tray types, especially mesh or wire basket trays, vertical bends can be formed on-site by cutting and reshaping side rails or wires to achieve the desired elevation change
