

Indonesia s hybrid fiber optic cable ADSS

Article Overview

Indonesia has implemented hybrid fiber optic ADSS cables, combining all-dielectric self-supporting technology with advanced sensing capabilities for efficient telecommunications and industrial applications.

Overview of ADSS Cables

All-dielectric self-supporting (ADSS) cables are optical fiber cables designed to support themselves between structures without metal elements, making them ideal for installation along overhead power lines and other elevated structures . They are lightweight, small in diameter, and resistant to environmental factors such as wind, ice, and UV exposure. ADSS cables typically use single-mode fibers with wavelengths of 1310 or 1550 nm, allowing circuits up to 100 km without repeaters, and can carry up to 864 fibers in a single cable . The fibers are protected in loose buffer tubes or ribbon configurations, with aramid yarns providing tensile strength and a protective outer sheath preventing moisture and UV damage .

Hybrid Fiber Optic Cable in Indonesia

The first implementation of hybrid fiber optic cable in Indonesia was applied in the oil and gas sector for Vertical Seismic Profiling (VSP) surveys in East Kalimantan . This hybrid cable integrates distributed acoustic sensing (DAS) technology within the wireline cable, allowing seismic data acquisition during any wireline run without additional rig time. The technology improves operational efficiency, reduces costs, and enhances data quality, providing high-frequency VSP data and robust well-to-seismic ties . The workflow includes planning, real-time field execution, and advanc...
