

Installation method of circuit breaker in secondary distribution box

Article Overview

To install a circuit breaker on a subpanel, you must first ensure proper load calculation, wiring, and grounding according to electrical codes, then connect the breaker to the subpanel's bus bar safely.

Planning and Preparation

Before installation, determine the total electrical load for the new circuit to select the correct breaker size and wire gauge. Consider future expansion and leave room for additional breakers in the subpanel . Ensure the subpanel is located in a dry, accessible area with at least 3 feet of clear working space in front, as required by NEC Article 110.26 .

Selecting the Breaker

Choose a breaker that matches the load type (resistive, inductive, or capacitive) and amperage of the circuit it will protect. For a subpanel, use a two-pole breaker if feeding a 240V circuit or a single-pole breaker for 120V circuits . Ensure the breaker is compatible with the subpanel's bus bar.

Wiring the Subpanel

- Turn off the main power at the main service panel to ensure safety .
- Run feeder wires from the main panel to the subpanel. A four-wire system is required: two hot wires, one neutral, and one ground
