

Is it good to have a built-in router in fiber optic broadband

Article Overview

Having a built-in router in a fiber optic broadband setup can be convenient, but its performance depends on the router's specifications and your usage needs.

Advantages of Built-in Routers

A built-in router simplifies setup because it combines the modem and router into a single device, reducing the number of devices and cables required. It is typically pre-configured to work with your ISP's fiber connection, ensuring compatibility and basic functionality without additional configuration. For standard home use, such as web browsing, streaming, and light video conferencing, a built-in router can provide reliable connectivity.

Limitations

Not all built-in routers are optimized for high-speed fiber connections. Fiber broadband can deliver gigabit or multi-gigabit speeds, and a router with outdated Wi-Fi standards (e.g., Wi-Fi 4 or 5) or limited LAN ports may not fully utilize the available bandwidth. Built-in routers often have fewer advanced features, such as LAN aggregation, MU-MIMO, or Wi-Fi 6/7 support, which are important for handling multiple devices, gaming, or large homes.
