

Is the connection box a distribution box

Article Overview

No, a connection box (or junction box) is not the same as a distribution box; they serve different purposes in an electrical system.

Key Differences

Distribution Box: A distribution box, also called a distribution board or DB box, is the central hub of an electrical system. Its main function is to receive incoming power and distribute it to multiple circuits while providing protection through devices like circuit breakers, fuses, or residual current devices (RCDs). It ensures safe and organized power allocation, prevents overloads, short circuits, and allows maintenance of individual circuits without disrupting the entire system. Distribution boxes are typically larger and handle higher current loads, making them essential in homes, industrial facilities, and large buildings.

Connection Box (Junction Box): A connection box, often referred to as a junction box, is primarily used to join, branch, or redirect electrical wires. It contains splices, terminal blocks, or connectors but does not house protective devices like breakers or fuses. Its purpose is to provide a safe enclosure for wire connections, protecting them from physical damage, moisture, and accidental contact. Junction boxes are usually smaller and located between the distribution box and the load (e.g., lights, motors, or appliances).

Terminal Box: For completeness, a terminal box is used at the end of a circuit, often mounted on equipment, to connect supply wires directly to a device. In fiber optic systems, a terminal box serves as a termination point for cables, while a distribution box in such networks manages multiple connections and splices.
