

Ladder-type cable trays conform to

Article Overview

Ladder-type cable trays are open-structured systems with side rails and evenly spaced rungs, designed for heavy-duty cable support, ventilation, and compliance with international standards.

Overview

Ladder-type cable trays consist of two longitudinal side rails connected by evenly spaced rungs, resembling a ladder. This open design allows maximum airflow, which helps dissipate heat generated by current-carrying conductors, reducing the risk of overheating. The structure also minimizes dust accumulation and prevents moisture or hazardous gases from being piped into electrical equipment, making it ideal for industrial and commercial applications .

Materials and Construction

These trays are typically made from galvanized steel, aluminum, or fiber-reinforced plastic (FRP), depending on environmental conditions and load requirements. The rungs are designed to bear the weight of heavy power, control, instrumentation, and communication cables. Wider trays and wider rung spacing can reduce overall strength, so manufacturers often provide load charts to ensure safe installation .

Dimensions and Rung Spacing

Ladder trays are available in widths ranging from 6 to 48 inches and rung spacings of 6, 9, 12, or 18 inches. Smaller rung spacings (6-12 inches) are recommended for s...
