

Lighting Distribution Box Circuit Specifications

Article Overview

A lighting distribution box must be configured with properly rated breakers, clear wiring, protective devices, and compliant layout to ensure safety, reliability, and maintainability.

Component Selection and Standards

All components in a lighting distribution box should comply with international and national standards such as IEC 309-1, IEC 60309, DIN EN 60309, and GB11918-2001. Switches, breakers, and terminals should be high-quality products from reputable manufacturers like ABB or Schneider to ensure reliability and safety. Miniature Circuit Breakers (MCBs) protect individual circuits from overcurrent, while Residual Current Devices (RCDs) or RCBOs protect against earth faults and leakage currents. Surge Protective Devices (SPDs) safeguard equipment from voltage spikes.

Circuit Configuration

A typical lighting distribution box configuration includes:

- Incoming main switch: e.g., 32A three-pole air switch for total power supply.
- Branch circuits: e.g., 16A single-pole breakers for lighting circuits and 20A two-pole breakers for specialized loads.
- Busbars: Provide a low-resistance connection between incoming power and breakers, ensuring efficient power distribution
