

Location of the power distribution box module

Overview

There are three electrical modules, a main power distribution module (PDM) located under the hood on the driver's side above the fender, a chassis module located between the frame rails, and a cab module located to the left of the driver under the switch panel. The main PDM distributes battery. A power distribution box is a key part of any electrical system. It takes electricity from the main source and safely sends it to different circuits in a home, office, or industrial setup. A distribution board (also known as panelboard, circuit breaker panel, breaker panel, circuit breaker, electric panel, fuse box or DB box) is a component of an electricity supply system that divides an electrical power feed into subsidiary circuits while providing a protective fuse or circuit. MCCB is used for making and breaking incoming power where ACB incomer supply is connected with LT panel and outgoing is connected with APFC panel busbar.
