

Madagascar Fiber Optic Cable Reel Measurement

Article Overview

Fiber optic cable reels should be measured and tested for continuity, length, and insertion loss before installation to ensure quality and prevent installation issues.

Measuring Fiber Optic Cable on Reels

Before deploying fiber optic cables in Madagascar or elsewhere, it is essential to verify the cable on the reel:

- **Continuity Test:** Check the cable for breaks or damage using a visual fault locator or OTDR before installation. This ensures the cable has not been damaged during shipping or handling .
- **Length Measurement:** Use an Optical Time Domain Reflectometer (OTDR) to measure the cable length accurately. Set the fiber group index (e.g., 1.4670 for 1310 nm, 1.4675 for 1550 nm) to convert the time-of-flight of the OTDR pulse into distance .
- **Insertion Loss:** Measure the optical loss using a light source and power meter (LSPM or OLTS). This involves connecting a launch cable to the source, the fiber under test, and a receive cable to the meter to determine the total loss in dB .

Reel Dimensions and Handling

Fiber optic cables are typically wound on standard reels or drums, which vary in diameter and width depending on cable type and length. Common considerations in...
