

Manual Temperature Control Distribution Box

Article Overview

A Manual Temperature Control Distribution Box is a device designed to regulate and distribute precise heating to connected elements, typically using PT100 sensors and self-limiting PTC heaters for laboratory or industrial applications.

Overview and Functionality

A manual temperature control distribution box allows users to set and maintain specific temperatures for connected heating elements, such as laboratory measurement cells or industrial components. It typically includes a temperature controller (e.g., Maxwell FT100 or TEC-9400 PID), a solid-state relay for smooth power switching, and analog or digital outputs for monitoring and integration with other systems. The box ensures stable temperature control without causing voltage or current spikes that could affect sensitive equipment.

Components

- **Temperature Controller:** Provides precise regulation and allows manual adjustment of setpoints.
- **PT100 Temperature Sensors:** Required for accurate temperature measurement; the box operates only with compatible sensors.
- **Heating Elements:** Often self-limiting PTC heaters that prevent overheating.
- **Connection Terminals:** 4 mm jacks or pre-wired terminals for safe and reliable heater connections....
