

Metal casing of distribution box

Article Overview

Metal casings for distribution boxes provide mechanical protection, electrical safety, and effective grounding for internal components.

Purpose and Benefits

Metal casings are widely used for distribution boxes because they protect internal electrical components from mechanical damage, dust, and moisture, while also providing electrical safety. When a strong external electric field, such as lightning, occurs, the metal casing redistributes charges on its surface, shielding the internal equipment from electrical surges and preventing damage. Additionally, grounding the metal chassis ensures that any induced charges are safely discharged, protecting operators from electric shock.

Material and Design

Most metal casings are made from stainless steel or other durable metals, which offer high mechanical strength and corrosion resistance. The design often includes ventilation holes or heat sinks to allow proper heat dissipation, preventing overheating of internal components. The size and length of the casing can be customized based on the number and layout of the electrical components inside, with typical lengths around 600mm for standard applications.

Installation and Features

Metal distribution boxes can be surface-mounted, flush-mounted, or floor-mounted,...
