

Moving Fiber Optic Interface Routers

Article Overview

Relocating a fiber optic router requires careful handling of the fiber cable and may involve Ethernet extensions or network switches to maintain connectivity.

Key Considerations

Fiber Cable Limitations: Fiber optic cables are fragile and have a minimum bend radius, typically around 10 cm. Bending or stretching the cable excessively can break the glass inside, causing signal loss or permanent damage, so direct relocation of the ONT or fiber modem is often limited by the existing cable path .

ONT and Router Placement: The ONT (Optical Network Terminal) is usually installed near the fiber entry point. Moving the router far from the ONT can reduce performance if a direct fiber connection is not feasible. It is generally recommended to keep the ONT and router in the same room for easier troubleshooting and optimal signal distribution .

Ethernet Extensions: If relocating the router is necessary, the most practical solution is to run a single Cat6 Ethernet cable from the ONT to the new router location. You can then use a network switch or configure a secondary router as an access point to provide multiple Ethernet ports in the new room. This setup allows multiple devices to share the connection, though each port will share the total bandwidth .

Wi-Fi and Signal Coverage: Before moving the router, assess Wi-Fi signal strength in different areas using apps or signal meters. Choose a location that minimizes interference from walls, appliances, or electronics to maintain strong coverage throughout the property .

Alternative Solutions: If running Ethernet is difficult, consider using powerline adapters or high-quality Wi-Fi extenders. These can bridge the connection from the ONT to the new router location without extensive cabling, though speeds may be lower than a direct Ethernet connection .
