

Optical junction box splitter

Article Overview

Optical splitters are often housed within junction boxes to protect and organize fiber connections while enabling signal distribution in PON networks.

Role of Optical Splitters

An optical splitter is a passive device that divides a single optical signal into multiple outputs or combines multiple signals into one, enabling efficient distribution of fiber signals to multiple end users in networks like GPON, EPON, or FTTH . Splitters can be FBT (Fused Biconical Taper) for small splits or PLC (Planar Lightwave Circuit) for larger, uniform splits, supporting configurations from 1×2 up to 1×64 . They are critical for sharing a single OLT port among multiple subscribers, reducing fiber and equipment costs.

Function of Junction Boxes

A junction box is a protective enclosure that houses fiber connections, splices, and sometimes optical splitters. It provides mechanical protection, environmental shielding, and organized routing for fibers, preventing damage and signal loss . Junction boxes are installed in various locations, such as on poles, in manholes, or at building entrances, depending on network design.

How They Work Together

Optical splitters are often pre-installed or mounted inside junction boxes to simplify deployment and maintenance . The junction box allows technicians to:...
