

# Pipes in the distribution box

## Article Overview

Pipes in a distribution box direct effluent from the septic tank to multiple drain field lines, ensuring even flow and preventing overload.

### Function of Pipes

The inlet pipe carries clarified effluent from the septic tank into the distribution box. Inside the box, the effluent pools to the level of the outlet ports, and outlet pipes then carry the wastewater to the lateral lines of the drain field. This setup ensures that each leach line receives an equal share of effluent, preventing any section of the drain field from becoming overloaded and maintaining the system's efficiency .

### Pipe Materials and Sizes

Distribution box pipes are commonly made of PVC due to its durability, corrosion resistance, and ease of installation, though concrete or HDPE pipes may also be used in some systems . Typical pipe diameters vary depending on system size:

- Inlet pipe: Usually DN50 (50 mm) or equivalent, matching the septic tank outlet .
- Outlet pipes: Can range from DN25 to DN75 (25–75 mm), with larger systems using multiple outlets to distribute flow evenly .
- Overflow pipe: Often DN75 to prevent backup in case of high effluent levels . A drainage tee is often installed on the inlet pipe to allow for cleaning and maintenance .
