

PoE Modules and Switches

Article Overview

PoE modules and switches enable simultaneous data and power delivery over Ethernet cables, supporting devices like IP cameras, VoIP phones, and IoT equipment.

Overview of PoE Technology

Power over Ethernet (PoE) allows both power and data to be transmitted through a single Ethernet cable, eliminating the need for separate power sources at the device location. PoE is standardized under IEEE 802.3af, 802.3at, and 802.3bt, which define different power levels to accommodate a wide range of devices . This technology is widely used in office networks, industrial environments, and smart infrastructure applications .

PoE Modules

PoE modules are compact integrated circuits or boards that provide power conversion and delivery for powered devices (PDs). They are designed to comply with IEEE standards and often include built-in signature recognition to ensure safe power negotiation . Key features include:

- High efficiency and minimal external components, reducing design complexity .
- Various package types such as Single-In-Line (SIL), Dual-In-Line (DIL), and Surface Mount (SMT) to suit different applications .
- Support for high-power devices, including Type-3 (up to 51W) and Type-4 (up to 90W per port) applications .
- Rapid deployment for IoT, industrial automation, security, and AV systems
