

Power capacity of the secondary distribution box

Article Overview

Secondary distribution boxes typically handle power capacities up to 2000–3000 kVA, with individual transformers rated up to 1500 kVA.

Overview

A secondary distribution box is part of the low-voltage (LV) network that receives power from a distribution transformer and distributes it to end users, such as residential, commercial, or industrial loads. These boxes are usually installed at the point of entry for buildings, factories, or complexes and may include LV switchgear, circuit breakers, fuses, and meters to manage and monitor power flow.

Typical Ratings

- Total substation capacity: 2000–3000 kVA
- Individual transformer rating: up to 1500 kVA
- Voltage levels: LV distribution is commonly 120/240 V (single-phase) or 415/240 V (three-phase) depending on the region
- Switchgear capacity: Commercial LV switchgear typically has a rupturing capacity of around 43 kA

Configuration and Reliability

Secondary distribution boxes can be configured in radial or ring-main networks. Rin...
