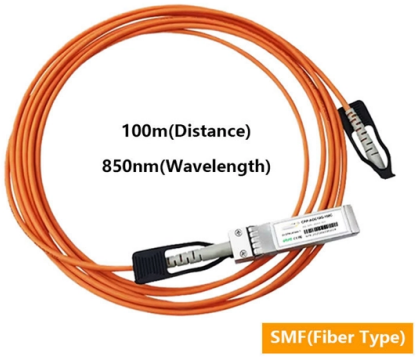
Principle of Detachable Optical Power Meter



Article Overview

A detachable optical power meter is an optical measurement device with a removable sensor head that allows flexible, calibrated measurement of light power in fiber optic or laser systems.

Overview

A detachable optical power meter functions like a standard optical power meter (OPM), measuring the power of light signals, typically in fiber optic networks, using a photodiode or thermal sensor to convert light into an electrical signal for display in watts or dBm . The key distinction is that the sensor head is separate from the display or console unit, allowing users to swap sensors for different wavelengths, power ranges, or measurement types without replacing the entire meter .

Components
• Sensor Head: Contains the photodiode or thermal sensor, sometimes with built-in optical attenuators to extend the measurement range. The calibration data is often stored in the sensor itself, enabling accurate readings when connected to the console .
• Console/Display Unit: Receives signals from the sensor head and displays the measured optical power. It can be a handheld or benchtop unit, often supporting multiple sensor connections for different applications .
• Connection Interface: A standardized connector allows the sensor head to be easily attached or detached from the console, facilitating portability and modularity ....
