Principle of Four-Lens Beam Modulation Module

Overview

It is based on the acousto-optic effect, i. the modification of the refractive index of some crystal or glass material by the oscillating mechanical strain of a sound wave (photoelastic effect). ABC Stimulo Photonics designs and manufactures fiber optic cables, optical transceivers, ODF frames, data center cabling solutions, MPO/MTP components, and FTTH equipment for telecom, data centers, an. After explaining the working principle, it explains key performance aspects such as diffraction efficiency, contrast ratio, switching time, and required RF power, including important trade-offs. A simple example is an overhead projector transparency. Our SLMs consist of liquid crystal (LC) pixels, each independently addressed, acting as separate variable retarders. This phase control is highly stable with minimal fluctuations and minimal crosstalk with.
