

Principle of Wireless Optical Modules

Overview

At the heart of every optical transceiver lie three essential components, often called the “Three Pillars” of optical communication: Laser — generates light. Modulator — encodes data onto the light. In the era of 5G, AI, and high-speed data centers, optical modules serve as the core bridge for converting electrical signals to optical signals (and vice versa), enabling fast, reliable data transmission across networks. This assembly comprises a light source, such as a laser diode or a semiconductor light-emitting diode (LED), an optical interface, a. A key requirement for optical wireless communication is a Line of Sight (LOS) connection between the transmitter and receiver. OWC wirelessly transmits data using light waves across the infrared (IR), visible, and ultraviolet (UV) spectra.
