

Pure light-controlled switch module

Article Overview

A pure light-controlled switch module automatically turns electrical devices on or off based on ambient light levels, providing energy-efficient and hands-free control.

Core Function

A pure light-controlled switch module, often called a photoelectric or photocell switch, functions by detecting the intensity of ambient light and using it to control an electrical circuit. When the surrounding light falls below a preset threshold, the module activates the connected load (e.g., outdoor lights), and when light exceeds the threshold, it deactivates the load, eliminating the need for manual operation .

Key Components

- Light Sensor (Photocell or LDR): Detects ambient light. Its resistance changes inversely with light intensity—resistance decreases as light increases, and vice versa .
- Comparator Circuit: Compares the sensor's voltage to a preset reference voltage to determine whether the light level has crossed the threshold .
- Relay or Transistor Switch: Opens or closes the electrical circuit to turn the connected device on or off .
- Control Circuit: Stabilizes the switching process, preventing false activations and allowing sensitivity adjustments for desired light levels .

Operation

- The light sensor continuously monitors ambient light...
