

Relay protection device for capacitor banks

Overview

This overcurrent relay detects an asymmetry in the capacitor bank caused by blown internal fuses, short-circuits across bushings, or between capacitor units and the racks in which they are mounted. Each capacitor unit consists of a number of elements protected by internal fuses. Capacitors in MV or HV compensations use oil as dielectric, which could catch fire in case of a damage. A permanent supervision of the state of the. Trench's capacitor protection relay is specifically designed to provide comprehensive protection of medium and high voltage capacitor banks and filter installations, thereby enhancing the safety and the efficiency of the system. The devices vary depending on the purpose and functionality of the application: they can be used for both automatic and manual power factor control applications and can contain a variety of dedicated protection functions.
