

Steel beam of distribution box

Article Overview

Steel beams for distribution boxes are typically fabricated as H-shaped or box-section members, designed to provide structural support, resist bending and torsion, and integrate with the box assembly.

Types of Steel Beams

Steel beams used in distribution boxes are commonly:

- **Box Section Beams:** Welded from steel plates into square or rectangular hollow sections, offering high torsional stiffness and anti-buckling properties. They are suitable for main beams, secondary beams, or truss beams in distribution box structures .
- **H-Beams or I-Beams:** Flanges and webs are assembled into H or I shapes, providing high bending resistance and ease of integration with other structural elements . Common steel grades include Q345B, Q355B, S355JR, ASTM A572 Gr.50, and A36, with options for weathering steel or stainless steel depending on environmental exposure .

Design Considerations

- **Load Capacity:** Beams are designed for factored loads, including dead and live loads, with deflection limits checked at service-level loads .
- **Section Selection:** Plastic and elastic section moduli are used to determine the appropriate beam size, ensuring the beam can resist bending moments and shear forces
