

The exhibition hall consists of several electrical distribution boxes

Article Overview

Exhibition halls use multiple electrical distribution boxes, often integrated with floor boxes, to safely and efficiently deliver power, data, and other utilities to all exhibit areas.

Overview of Distribution Boxes

A distribution box, also known as a power distribution box, is an enclosure that receives electrical power from a main supply and distributes it to multiple circuits safely and efficiently. These boxes help organize electrical connections, protect circuits, and improve maintenance efficiency in commercial and industrial settings, including exhibition halls. They can be indoor or outdoor, metal or plastic, depending on the environment and load requirements.

Floor Boxes and Utility Grids

In modern exhibition halls, floor boxes are commonly used to provide power, data, communications, audio/visual, water, and compressed air directly to exhibit booths. These boxes are installed flush with the floor and connected via under-floor raceways or conduits, allowing utilities to reach multiple booths without creating above-floor hazards. Floor boxes are often arranged in a grid pattern, with each box servicing several booth modules, typically based on a 10x10 foot booth layout.
