

The functions of fiber optic cables include

Article Overview

Fiber optic cables function by transmitting data in the form of light through ultra-thin strands of glass or plastic.

- The core of the cable carries the light signals, which bounce off the reflective walls (cladding) in a process called total internal reflection .
- A sender device converts data into light pulses, which travel at high speeds through the fiber .
- The receiver device then converts the light back into data for use .

This technology allows for high-speed, long-distance communication, making fiber optics a preferred choice for modern data transmission .
