

The network cable coming out of the fiber optic terminal box

Overview

Most FTTH networks are based on a PON network. The drawing below defines the network: a "feeder" cable extends from the OLT (optical line terminal) in the CO (central office) to a FDH (fiber distribution hub) where the PON (passive optical network) splitter is housed. It functions as a junction between the incoming fiber cable and the outgoing customer-side fiber cable, where one fiber can be spliced, patched. Fiber Termination Boxes (FTBs) are crucial components in fiber optic networks, facilitating the termination, connection, and management of optical fibers. Proper installation and maintenance of FTBs are essential to ensure the reliability and performance of the network infrastructure. Good quality fiber laying and termination systems help achieve minimal back reflection and low signal loss. They also feature resistance to moisture, impact, chemical exposure. Step 1: Access outdoor fiber optic cables into fiber terminal box for the purpose of splicing the optical fiber cable and fiber optic pigtail, leading out it by using fiber optic patch cable.
