

What do the specifications and model numbers of an optical splitter represent

Overview

An optical coupler is a passive device that can split or combine signals in optical fibers. They are named by the number of inputs and outputs, so a splitter with one input and 2 outputs is a 1X2, and a PON splitter with one input and 32 outputs is a 1X32. By dividing a single optical signal from a central Optical Line Terminal (OLT) into multiple outputs for Optical Network. In this guide, we'll break down what fiber splitters do, how they work, and how to choose the best model for your application. In simple terms, it allows one fiber input to serve multiple endpoints — without requiring any power supply. One main pipeline (fiber input) is split into. What are the technical parameters of optical passive splitters?

When we buy a optical passive splitter, firstly need to confirm what kind of fiber optic splitter we need and what indicators can be used as reference?

What does each indicator mean?

At present, commonly used FO splitters include 1xN.
