

What does N4 mean in optical switch

Article Overview

In optical switches, "N4" is not a standard designation; in telecommunications, N4 refers to a 5G network interface connecting the Session Management Function (SMF) to the User Plane Function (UPF).

Optical Switch Overview

An optical switch is a device that selectively directs light signals between input and output ports, enabling flexible routing of optical signals in fiber networks, data centers, and telecommunications systems . Optical switches can be classified by actuation methods:

- Mechanical Optical Switches: Use moving mirrors, prisms, or fibers to redirect light.
- MEMS (Micro-Electro-Mechanical Systems) Switches: Employ tiny movable mirrors controlled electrostatically for fast switching.
- Liquid Crystal (LC) Switches: Use liquid crystal alignment to control light polarization and direction. Switches are also categorized by configuration, such as 1xN (one input to multiple outputs) or NxN (multiple inputs to multiple outputs), but "N4" is not a recognized type in this context .

N4 in 5G Networks

In 5G telecommunications, N4 is a core network interface, not an optical switch designation . Its role is:

- Connection: Links the Session Management Function (SMF) to the User Plane Func...
