

What does a relay protection setting notification mean

Overview

Typically the relay will operate a switch (relay contact) to indicate that an input has surpassed a setting, or the relay can provide notification through visual feedback such as a meter or LED. PSM represents how many times the actual current is above the relay's current pickup setting. It is the key quantity utilized in IDMT. The protected zone is the part of the network in which faults cause the protection function to operate. Definite time delay means that the protection operate time does not change or depend on the. This handbook covers the code of practice in protection circuitry including standard lead and device numbers, mode of connections at terminal strips, colour codes in multicore cables, dos and don'ts in execution. Also principles of various protective relays and schemes including special protection. Core idea: Protective relays monitor electrical quantities and command protective devices to isolate faults or abnormal operating conditions. Plug Setting Multiplier (PSM):. A INTRODUCTION protection relay is TO a smart PROTECTION device that RELAYS receives inputs, compares them to set points, and provides outputs.
