

What does fiber optic patch cord split mean

Article Overview

A split fiber optic patch cord is designed to divide light from a single input fiber into multiple output fibers, enabling simultaneous distribution of optical signals.

Overview

A split fiber optic patch cord is a specialized optical cable that takes light from a single large-core fiber and splits it into two or more smaller-core fibers. This allows the same optical signal to be distributed across multiple outputs while maintaining uniform light intensity. The splitting is typically achieved using a 15 cm long large-core fiber that ensures even light distribution before branching into multiple fibers inside a central tubing .

Key Features

- **Branching:** Standard cords usually have 2 branches, but more branches can be customized.
- **Power Distribution:** A 2-branch splitter typically outputs around 16% of the input power per branch, with variations depending on fiber type and area recovery ratio .
- **Connectorized Ends:** Each branch has its own connector, allowing easy integration with optical devices or networks.
- **Applications:** Commonly used in optogenetics to share powerful laser or LED light sources among multiple fibers, ensuring consistent light intensity across outputs
