

What electrical appliances are used in a level 3 distribution box

Overview

A distribution box houses all the contact breakers, earth leakage units, doorbells, and timers. The electrical power supply comes from the network to the building through the main feeding cable. In. A distribution box is a low-voltage electrical enclosure that receives incoming power and distributes it safely to multiple outgoing circuits through protective and switching devices such as MCBs, RCDs, RCBOs, fuses, isolators, busbars, neutral bars, earth bars, and surge protective devices. But what exactly is a power distribution box, and why is it so essential in our daily lives?

The DB panel board controls the flow of electricity. Three level distribution box: a distribution box is set under the main distribution box, a switch box is set under the distribution box, and electrical equipment is set under the switch box to form a three-level distribution box. From there, it is routed to individual building distribution boxes (secondary distribution boxes), which subsequently supply power to unit-level distribution boxes. The main electrical appliances are refrigerator, induction cooker and microwave oven. The air conditioner switch needs to be replaced, as does the main switch. The main switch does not have leakage.
