

What equipment is the indoor fiber optic cable connected to

Overview

Installed on the exterior or interior of a home, the Optical Network Terminal (ONT) —also known as a modem— is the interface between the fiber optic cable and your home network. Indoor fiber cable is the backbone of modern communication networks within buildings, providing the high-speed data transmission necessary for everything from business operations to home entertainment. As our reliance on fast, reliable internet connectivity grows, so does the importance of. The following are some common use cases for fiber networks in home or office environments. This technology offers several advantages over traditional copper-based internet, including: Higher Bandwidth: Capable of supporting higher data. Unlike copper wires used in cable internet, fiber-optic cables consist of thin, glass fibers that transmit data as pulses of light, carrying information much faster with less interference. Professional crews install these lines below ground, making them less susceptible to storm damage and. Even fiber to the home architectures are being used in premises networks. Fiber offers several advantages for LAN backbones.
